

Premieres remarques sur les peuplements de l'etage bathyal de la basse Adriatique

Exploratory trawl fishing was performed in the Southern Adriatic Sea. Comparison of bionomic characteristics and bottom fauna of Southern Adriatic with Southern Tyrrhenian ones, led to the following observations: a bathymetric expansion of the bathyal biocoenosis horizons, absence of spp which are very abundant in Southern Tyrrhenian bathyal biocoenosis, reduction of mean size for some spp, a general impoverishment of the bathyal biocoenosis itself, presence of new sp for the Adriatic sea.
