

Les Merlus d'Afrique du sud et leur peche

This study concerns mainly 2 species *Merluccius capensis* and *M. paradoxus*; *M. polli* is a more northern species though the 3 species are known to inhabit the same regions. The life cycle, seasonal migrations geographical distribution and fishing grounds of the 2 main species are discussed in detail. The intensity of fishing in this region, over the past 10 years has increased to such an extent that during 1968 -1970 this production accounted for one half level on a world-wide basis. Attempts have been made by Britain to market this fish as a frozen product.
