

Paraonidae (Polychètes sédentaires) de l'Adriatique

During several investigations of the marine bottom fauna of the Adriatic Sea in 1972 and 1973 19 species belonging to the polychaete family Paraonidae - an abundant group in this kind of sediment - were collected. Three new species : *Paraonides myriamae* sp. n., *Aricidea (Allia) pseudannae* sp. n., *Aricidea (Allia) mariannae* sp. n. are described, their taxonomic positions discussed, and some ecological data are given. In addition only a part of a specimen *Arkidea* sp. was obtained but certainly it belongs to a new species. [NOT CONTROLLED OCR]
